Matrix Inversion

1. Iterative methods in matrix form

$$Ax = b (1)$$

$$A_1x = A_2x + b (2)$$

$$A_1 x = A_2 x + b$$
 (2)

$$A_1 x^{(k+1)} = A_2 x^{(k)} + b$$
 (3)

- 2. Properties of the matrix decomposition for convergence of the system of equations.
 - A_1 should be *easily* invertible.
 - Iterations should converge, hopefully quickly.
 - Let $\epsilon^{(k)} = x x^{(k)}$ be the error at the kth iteration. Then, subtracting the above equations gives,

$$A_{1}x - A_{1}x^{(k+1)} = A_{2}(x - x^{(k)})$$

$$A_{1}\epsilon^{(k+1)} = A_{2}\epsilon^{(k)}$$

$$\epsilon^{(k+1)} = A_{1}^{-1}A_{2}\epsilon^{(k)}$$

$$\epsilon^{(k)} = (A_{1}^{-1}A_{2})^{k}\epsilon^{(0)}$$

$$\epsilon^{(k)} \to 0 \text{ iff } ?$$

$$(4)$$

$$(5)$$

$$(6)$$

$$(7)$$

$$(8)$$

$$A_1 \epsilon^{(k+1)} = A_2 \epsilon^{(k)} \tag{5}$$

$$\epsilon^{(k+1)} = A_1^{-1} A_2 \epsilon^{(k)} \tag{6}$$

$$\epsilon^{(k)} = (A_1^{-1}A_2)^k \epsilon^{(0)} \tag{7}$$

$$\epsilon^{(k)} \to 0 \quad \text{iff} \quad ? \tag{8}$$

- 3. Point-Jacobi: $A_1 = D$, $A = A_1 A_2$, $A_2 = A_1 A = D A$.
- 4. Gauss-Seidel: $A_1 = D L$, $A_2 = U$.

5. SOR: similar to Gauss-Seidel with an extra step for relaxation

$$\phi^{(k+1)} = \phi^{(k)} + \omega(\tilde{\phi}^{(k+1)} - \phi^{(k)}) \tag{9}$$

$$\phi^{(k+1)} = \phi^{(k)} + \omega(\tilde{\phi}^{(k+1)} - \phi^{(k)})
D\phi^{(k+1)} = L\phi^{(k+1)} + U\phi^{(k)} + b$$
(9)

$$\phi^{(k+1)} = \underbrace{[I - \omega D^{-1}L]^{-1}[(1 - \omega)I + \omega D^{-1}U]}_{G_{SOR}}\phi^{(k)} + [I - \omega D^{-1}L]^{-1}\omega D^{-1}b$$
 (11)

6. Consider the parabolic PDE

$$\frac{\partial \phi}{\partial t} = \alpha \left(\frac{\partial^2 \phi}{\partial x^2} + \frac{\partial^2 \phi}{\partial y^2} \right) \tag{12}$$

Develop finite difference approximation for trapezoidal method in time and show that it can be solved using direct inversions of two tri-diagonal matrices using a approximate factorization technique.
